InnovaSonic

The Transit-Time Ultrasonic Flow Meters for Precise Liquid Flow Metering / BTU Measurement
What does it mean to challenge the status quo?

With skyrocketing energy costs, there has never been a better time to invest in the precise flow measurement required to maximize your heating and cooling system efficiency, meet regulations, and bring down costs.

Designed, built and calibrated by Sierra for non-intrusive liquid flow metering, and optimized for thermal energy / BTU measurement, the InnovaSonic® 207i transit-time ultrasonic flow meter is the ideal turnkey solution for building and district metering, and submetering. BACnet is also available for integration into building automation and control systems.

The Flow Engine Behind it All

At the heart of every 207i is advanced digital signal processing to enhance ultrasonic transit-time flow metering technology and fluid dynamic measurements.

Sierra’s Raptor™ OS is the true “Brain” of the instrument and includes a revolutionary, living, learning algorithm set made possible by today’s powerful microprocessors. Raptor 2 manages changes in liquid flow, temperature, and pressure. The result is a proprietary, fundamentally different liquid flow rate calculation using all pertinent variables for the most precise, stable and accurate flow energy measurement possible.

The OS interfaces with many of Sierra’s software apps to read, adjust and even upgrade the meter firmware in the field.

Thermal Energy / BTU Metering

The 207i calculates thermal energy / BTU flow energy and provides you with the highest accuracy measurements possible to manage energy costs.

A critical element of any thermal energy / BTU flow energy measurement is determining the amount of heat transferred between the cold and hot flow legs of a heating or cooling process.

Often with only a small difference in temperature between the two flow legs, a precise measurement makes a huge difference.

Sierra calibrates the entire flow energy package—flow meter and temperature transmitters—as a system to improve accuracy. Raptor takes into account this temperature difference as well as all fluid properties required to accurately measure flow, and makes ultra-precise temperature measurements between the cold and hot flow legs.

High Accuracy Through Density Compensation

Raptor also enables improvements in liquid flow metering accuracy. Since an ultrasonic flow meter detects the speed of sound in the liquid being measured, a small change in liquid density can have a big impact on accuracy and repeatability.

By adding a temperature input from a transmitter provided by Sierra or by using an external input from an existing transmitter, the 207i can calculate real-time liquid density, assuring accuracies of +/- 0.5% of reading from 0.16 to 40 ft/s (0.05 to 12 m/s).
207i Highlights

- Accuracy +/- 0.5% of reading from 0.16 to 40 ft/s (0.05 to 12 m/s)
- One meter for a wide range of pipe sizes from 2 to 236 inches (50 to 6000 mm)
- Clamp-on or insertion transducers measure bi-directional flow
- Optional clamp-on or insertion PT 100 temperature inputs for thermal energy/BTU measurement
- Optional current input modules for pressure, temperature, & density
- Clamp-on transducers operating temperature range: 14˚F to 176˚F (-10˚C to 80˚C)
- Clamp-on high-temperature transducers operating temperature range: 14˚F to 302˚F (-10˚C to 150˚C)
- 1.5 in (38.1 mm) insertion diameter transducers; operating temperature range: -40˚F to 176˚F (-40˚C to 80˚C)
- Keypad with 16 tactile keys with 14 dual-function keys with audible feedback
- Flow totalizer
- Memkey: automatically detects sensor type; calculates optimal mounting
- Internal memory datalogger
- BACnet and Modbus (optional)

Notable Apps

- ValidCal Diagnostics
- Datalogging
- Meter tuning
- Quick Start
- Signal setup
- EnergyPro

Making it Easier

With the InnovaSonic 207i’s clamp-on sensors, there’s no pipe cutting or expensive plumbing.

The 207i features a large backlit display and dual-function keypad with audible feedback. With its visual sensor spacing tool on the display (see photo in center), slightly move the sensors together or apart to position the indicator line between the “goal posts” and assure optimal signal strength.

Easily connect the 207i to your building management system with Modbus or BACnet communications. With its robust stainless steel enclosure, permanently fasten the transducers to make it a hardened installation, and you’re ready to measure for years to come.

It Has Apps

The InnovaSonic 207i is the first transit-time ultrasonic flow meter to come with a comprehensive software package of apps for ease of use, field upgrades, and calibration validation.

Apps like MeterFit™ help you optimize signal strength to assure best performance.

Apps like EnergyPro™ allow you to fully configure your thermal energy / BTU flow energy measurement system, including datalogging and totalization of all energy functions.

Apps like ValidCal™ Diagnostics make field calibration validation easy.

Sierra has many more apps under development to enhance your product experience.
**WaterLoop World Class Calibration**

Designed by Sierra and located at our metrology headquarters in Monterey, California, Sierra’s Water-Loop™ is among the world’s most accurate liquid/gas calibration facilities.

Rated at +/- 0.2% of reading, all calibrations follow the guidelines of ISO 17025 and are directly traceable to national standards such as NIST (US National Institute of Standards and Technology).

Fully automated, once flow application data is programmed, calibration automation software manages all aspects of flow calibration testing. This results in high-speed time-aligned data acquisition and performance analysis over the entire flow measurement range, and generates a calibration certificate documenting instrument performance upon completion.

**Service, Commissioning & Training**

The need to deliver fast, localized support to global customers has resulted in the establishment of dedicated Sierra Flow Centers on almost every continent. And they are backed up by technical experts in over 150 locations in more than 50 countries.

Sierra’s team of engineers can commission your flow meter to assure optimal performance and train you to get the most out of your instrument.

We provide lifetime support for all Sierra products and will get on a plane to help you when necessary.

**Sierra’s Big-3 Technologies**

The InnovaSonic 207i is one of three advanced flow meter technologies Sierra has developed to help facility managers tackle tough energy management challenges.

For what we call our Big-3, Sierra has become a recognized expert in thermal mass (QuadraTherm®), vortex shedding (InnovaMass®), and transit-time ultrasonic (InnovaSonic®). Sierra is the only company in the USA to manufacture all three flow technologies.

The Big-3 are optimized to be a complete solution for flow energy measurement—facility flows that impact costs like compressed air, natural gas, steam, and hot or chilled water.

As new apps and improvements become available, all Big-3 technologies benefit and are field firmware upgradable.

**PERFORMANCE SPECIFICATIONS**

**Fluids**
All acoustically conductive liquids with <5% solids or bubbles

**Quantities Measured**
Volumetric flow
Totalized volumetric and mass flow
Heat energy
Totalized energy flow
Density
Speed
Heat capacity
Enthalpy
Ambient temperature
Inlet and outlet temperature via PT 100 or current inputs
Pressure (optional)
Reynold’s number

**Pipe Size**
2 to 236 inches (50 to 6000 mm)

**Accuracy**
Accuracy +/- 0.5% of reading from 0.16 to 40 ft/s (0.05 to 12 m/s)

**Repeatability**
+/- 0.15% of reading > 0.16 ft/s (0.05 m/s)

**Resolution**
0.01 ft/s (0.00025 m/s)

**Response Time**
150 ms measuring cycle

**OPERATING SPECIFICATIONS**

**Flow Velocity Range**
Bi-directional flows: 0.16 to 40 ft/s (0.05 to 12 m/s)
Note: 0.08 ft/s (0.025 m/s) is the default low flow cut-off

**Temperature**
Ambient electronics: -4°F to 140°F (-20°C to 60°C)
Clamp-on transducer: 14°F to 176°F (-10°C to 80°C)
High temperature clamp-on transducer: 14°F to 302°F (-10°C to 150°C)
Insertion transducer: -40°F to 176°F (-40°C to 80°C)
Note: Insertion pressure limited to 300 psig (20 barg)

**Relative Humidity**
Up to 99% RH, (non-condensing)

**Power Supply**
AC powered 100-240 VAC, 50-60 Hz, 0.5 Amps
or DC powered 9-36 VDC, 0.5 Amps

**Analog Output**
Analog: active or passive 4-20 mA current loop
Accuracy: +/- 0.1% of reading
Active loop $R_{ext} < 750$ Ohm
Passive loop $V < 24$ VDC, $R_{ext} < 1$ kOhm
Note: For 1 to 5 VDC output, add 250 Ohm resistor to 4 to 20 mA loop.

**Digital Output**
Pulse output: 0 to 9999 Hz, OCT (min. and max. frequency adjustable)
Solid state relay, 250 VDC/VAC max, 100 mA max, 40 Ohm max on-state resistance no/nc (SPDT)

**Digital Communications**
RS-485, RS-232 and USB proprietary Sierra Protocol, Modbus RTU, BACnet

**Inputs**
Upstream and downstream ultrasonic transducers; 1 Mhz
Two PT 100 RTD temperature transducers (optional)
Two wire or four wire supported
Range: -40°F to 302°F (-20°C to 150°C)
Resolution: 0.018°F (0.01°K)
Accuracy: +/- 0.01% of reading +/- 0.05°F (0.03°K)
Configurable current inputs for temperature, pressure, and density

**SOFTWARE**

**Software**
Smart Interface Portal (SIP)
User-centered software allows for easy installation and field validation via USB or RS-232.

Includes Apps like:
Quick Install: Step-by-step meter commissioning and setup
MeterFit™: Makes transducer set up easy for a strong signal
EnergyPro™: Step-by-step thermal energy/ BTU setup
ValidCal Diagnostics™: Validate firmware & hardware health
Checks for:
Speed of sound (SOS)
Transit time, Delta T
Signal strength
Quality
Noise
TOM/TOS
Datalogging
Internal datalogging

**Datalogging**
Internal datalogging (data accessible via SIP)
PHYSICAL SPECIFICATIONS

Transmitter Enclosure
Wall-mounted, NEMA 4X (IP65) 316 stainless enclosure with five ¾-inch (19 mm) conduit holes pre-drilled across the bottom.

Transducers
Clamp-on transducers: encapsulated design IP68
Standard cable length: 30 ft (9 m)
Maximum cable length: 300 ft (90 m)
Memkey for automatic detection of sensor characteristics
Insertion transducers IP68

Transducer Mounting Methods
Pipe straps
Chain
Pipe clamps

Keypad
16 tactile keys with 14 dual-function keys, audible feedback

Display
160 x 240 graphic LCD backlit display

Weights
Transmitter: approximately 4.7 lb (2.2 kg)
Transducers: approximately 2 lb (0.9 kg)

OPTIONAL RTDS: CLAMP-ON OR INSERTION

Sierra offers clamp-on or insertion RTDs to make the precise ΔT measurement, so thermal energy BTU can be calculated with a high degree of accuracy (See page 10 and 11 for dimensional drawings).

PERFORMANCE SPECIFICATIONS

Accuracy
+/-0.12% at 0°C
Complete NIST-traceable calibration certificate

OPERATING SPECIFICATIONS

Temperature
Measurements up to 450°F (232°C)

Type
PT 100 RTD; 4-Wire; 100 Ohm, α = 0.00385 (standard)

Stability
0.2°C (0.4°F) after 10,000 hours at max temperature
(1 year, 51 days, 16 hours continuous)

Response Time
<5 seconds
Typical to reach a 63.2% temperature change

Humidity
Excellent moisture resistance for condensing environments
