

FLOWTRAK™

FlowTrak Flow Conditioning Plates

For use with BioTrak 645i, 645S, TM100, and TM500 Insertion Thermal Mass Flow Meters

DATA SHEET

FlowTrak Benefits

- Significantly reduces upstream and downstream pipe requirements
- Creates proper gas flow profile from irregularities caused by elbows, valves, expansions, reductions
- Minimal pressure drop
- Maximizes flow measurement accuracy in constrained piping environments
- Easily Installation
 - Easy to center in the pipe by aligning the outer edge of the flow conditioner with the outer edge of the flange
- Rugged 316 SS material
- Precision laser cut-design
- For use with BioTrak 645i, BioTrak 645S, TM100 Insertion, and TM500 Insertion thermal flow meters only
- Available in thirteen sizes for Schedule 40 pipes: 1.5", 2", 2.5", 3", 4", 6", 8", 10", 12", 14", 16", 18", and 20"

Optimizing Flow Profiles for Precision Accuracy

Achieving a uniform flow profile near the center of the pipe is crucial for ensuring flow meter accuracy. Sierra Instruments' FlowTrak™ flow conditioning plates for BioTrak and TM Series Insertion thermal mass flow meters are a cost-effective solution to common problems associated with monitoring flow installations where long, straight runs of piping are not available. The FlowTrak flow conditioning plates effectively eliminate velocity profile distortions, swirl, and temperature stratification in the gas stream.

Sierra's FlowTrak flow conditioners create a uniform velocity profile. Designed to work in schedule 40 pipe with 150# flanges, the FlowTrak is sandwiched between two 150# flanges, along with two gaskets. Easily center the FlowTrak in the pipe easily by aligning the outer edge of the flow conditioner with the outer edge of the flange.

Straight Pipe Run Solutions

In application installations where there isn't enough available space for the required upstream or downstream straight pipe, FlowTrak flow plates are a viable solution alongside an insertion-style flow meter. Insertion thermal mass flow meters are easy to install and require minimal straight pipe runs. In the past, the only option to reducing straight pipe runs for very tight spaces was to order flow meters with a flow body and built-in flow conditioner. To give customers more flexibility, Sierra Instruments has developed the FlowTrak flow conditioner for use with its BioTrak and TM Series insertion-style flow meters. Each flow meter is calibrated with the flow conditioner 2D upstream as shown in Figure 2 to ensure the highest accuracy.

Figure 1A: Fully Developed Laminar Flow

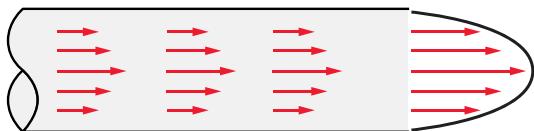

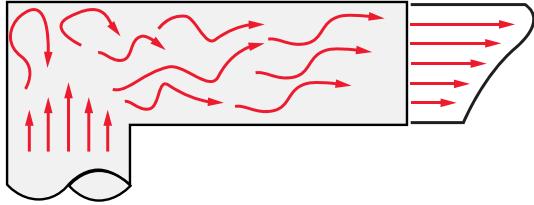

Figure 1B: Fully Developed Turbulent Flow

Figure 1C: Irregular/Distorted Flow Profile

Installation

Lateral placement

To determine where to install the FlowTrak flow conditioner, the pipe size is important. FlowTraks require 5 diameters (5D) of upstream straight pipe. Also, the flow meter's sensor should be 5D before any downstream disturbances. The distance between the FlowTrak flow conditioner and the flow meter's sensor is 2D. The relationship between pipe size and pipe diameters is illustrated in Figure 2 with lengths listed in Table 1 below. If more total straight pipe run than the minimum is available, most of it should be used upstream. The pressure drop can be minimized when the flow profile requires less correction.

Physical Specs

Sizing

FlowTraks are available in 13 sizes for Schedule 40 pipes:

1.5", 2", 2.5", 3", 4", 6", 8", 10", 12", 14", 16", 18", and 20".

For smaller pipe sizes, an inline flow meter is recommended.

Figure 2: Straight Pipe Run Requirements

FlowTrak Flow Conditioner installed between two flanges

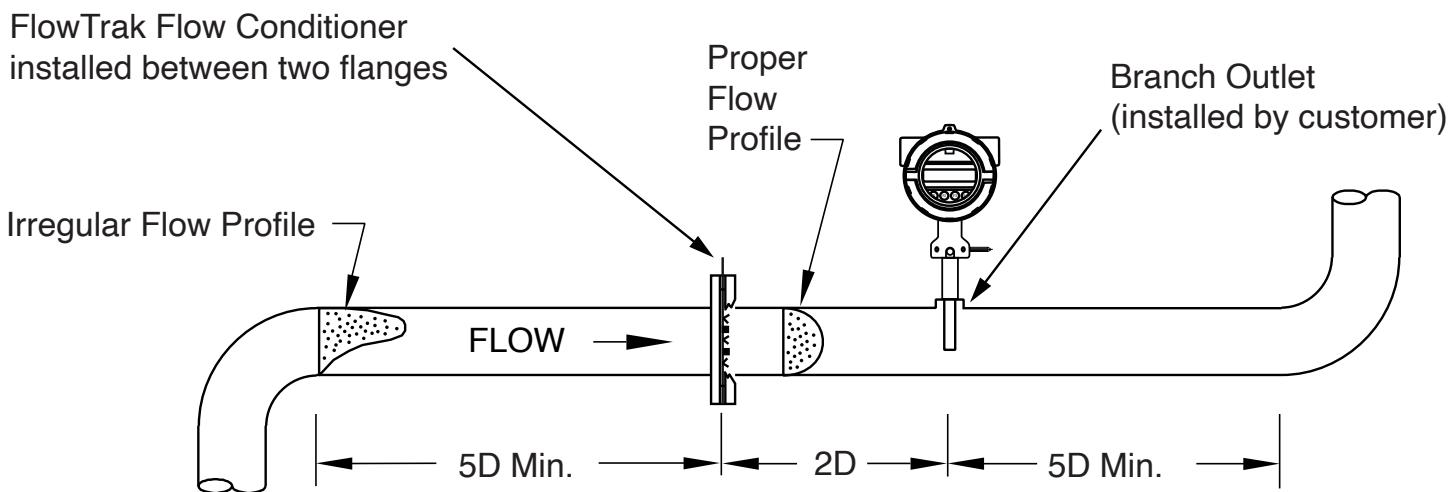

Table 1: Straight Pipe Run Requirements 1.5"- 8"

Schedule 40 Pipe Size Inch	2D Inch (mm)	5D Min. Up/Downstream Inch (mm)
1.5	3.22(82)	8 (203)
2	4.14 (105)	10 (254)
2.5	4.94 (125)	12 (305)
3	6.14 (156)	15 (381)
4	8.06 (205)	20 (508)
6	12.13 (308)	30 (762)
8	15.96 (405)	40 (1016)

Table 1.1: Straight Pipe Run Requirements 10"- 20"

Schedule 40 Pipe Size Inch	2D Inch (mm)	5D Min. Up/Downstream Inch (mm)
10	20.04 (509)	50 (1270)
12	23.88 (607)	60 (1524)
14	26.24 (666)	66 (1676)
16	30.00 (762)	75 (1905)
18	33.75 (857)	84 (2133)
20	37.62 (956)	94 (2389)

Performance

Equation

$$dP = 0.01786 * KE + 0.6343$$

Error for 95% Confidence Interval: +/-25%

The pressure drop can be minimized when the flow profile requires less correction.

Term Definitions

dP = Pressure Differential [mBar]

D = Actual Density [kg/m^3]

V = Actual Average Velocity [m/s]

KE = Kinetic Energy = $0.5 * D * V^2$

Installation

FlowTrak Orientation

Every FlowTrak has "UPSTREAM" etched into a tab extending out from the flow conditioner. This marker should be positioned parallel to the probe with the "UPSTREAM" etching facing toward the upstream portion of the pipe.

The FlowTrak is installed between 150lb flanges. Gaskets (supplied by customer) should be placed on both sides of the flow conditioner to ensure a seal.

See Figure 3 on the next page for proper installation orientation.

Please refer to the FlowTrak Quick Install Guide for BioTrak, TM100, and TM500 Series for further installation instructions.
